CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 IsoId=014522-2; Sequence=VSP_007802;
TISSUE SPECIFICITY: Expression is restricted to the CNS.
SIMILARITY: Contains 1 MAM domain.
SIMILARITY: Contains 1 immunoglobulin-like C2-type domain.
SIMILARITY: Contains 4 fibronectin type III domains.
SIMILARITY: Contains 2 protein-tyrosine phosphatase domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               L; AF043644; AAD09421.2; -...

"Cloning and characterization of R-PTP-kappa, a new member of the receptor protein tyrosine phosphatase family with a proteolytically cleaved cellular adhesion molecule-like extracellular region."; Mol. Cell. Biol. 13:2942-2951(1993).

-i- FUNCTION: Regulation of processes involving cell contact and adhesion such as growth control, tumor invasion, and metastasis. Forms complexes with beta-catenin and gamma-catenin/plakoglobin.

Beta-catenin may be a substrate for the catalytic activity of PTP-

-!- SIMMILARITY: Contains 1 MAM domain.
-!- SIMMILARITY: Contains 1 immunoglobulin-like C2-type domain.
-!- SIMMILARITY: Contains 4 fibronectin type III domains.
-!- SIMMILARITY: Contains 2 protein-tyrosine phosphatase domains.

CATALYTIC ACTIVITY: Protein tyrosine phosphate + H(2)0 = proteining the phosphate + phosphate.

SUBCELLULAR LOCATION: Type I membrane protein.

TISSUE SPECIFICITY: High levels in liver and kidney. Lower lines protein and heart. Not seen in spleen and testis.

In lung, brain and heart. Not seen in spleen and testis.

DEVELOPMENTAL STAGE: Developmentally regulated with highest protein areas capable of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                expression found in developing areas or developmental plasticity.

-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- TISSUE SPECIFICITY: Expressed in every tissue examined.
-!- SIMILARITY: Contains 1 protein-tyrosine phosphatase dom
-!- SIMILARITY: Contains 6 fibronectin type III domains.

                                          tyrosine + phosphate.
SUBCELIJIAR LOCATION: Type I membrane protein.
SIMILARITY: Contains 1 protein-tyrosine phosphatase
SIMILARITY: Contains 16 fibronectin type III domains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              1187

## ALIGNMENTS

PTP04; PTP05; PTP10; SAD; ALP; ALK-7; protein tyrosine phosphatase; type I receptor serine/threonine kinase; cancer; leukaemia; lymphoma; neurodegenerative disease; neuronal survival; Alzheimer's disease;

Mouse PTP05 isoform #1.

AAW89250;

AAW89250 standard; protein; 463 AA.

10-MAR-1999

(first entry)

Parkinson's disease; Huntington's disease.

```

The present invention describes isolated, acids encoding PTP04, SAD, PTP05, PTP10, present sequence represents mouse PTP05.

ALK-7, are protein tyrosine phosphatases

, enriched or purified nucleic ALP and ALK-7 proteins. The The above proteins, other than (PTPs) and are used to identify

Claim 2;

Page 157-158; 193pp; English.

These substances are used to treat of prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and lymphoma), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival, particularly for treating Alzheimer's, parkinson's or Huntington's diseases. Mucleic acid fragments of the polymucleotides encoding the proteins can be used as probes to identify and clone related sequences; to detect protein-encoded RNA; to generate transgenic animals and in generatery (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequence 463

The present sequence represents mouse PTD05. The above proteins, other than place of the protein tyrosine phosphatases (PTPs) and are used to identify substances that modulate their activity (i.e. agonists and antagonists, including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways that involve the proteins, particularly cancer (e.g. leukaemia and stripped proteins), while modulators of ALK-7 (which is a type I receptor serine/threonine kinase) are used to promote neuronal survival. Serine/threonine kinase) are used to promote neuronal survival. Serine/threonine kinase) are used to promote neuronal survival. Serine/threonine kinase) are used to promote neuronal survival. Serine/threonine kinase) are used to promote neuronal survival. Serine/threonine kinase) are used to promote neuronal survival. Serine/threonine can be used as probes to identify and clone related sequences; to detect protein-encoded kNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
                                                                                                                                                                                                                                                                                                                                                                                                       Query Match

                                                                                                                                             The present invention describes isolated, enriched or purified nucleic CC acids encoding PTP04, SAD, PTPD5, PTPD19, ALP and ALK-7 proteins. The present sequence represents mouse PTP05. The above proteins, other than CC ALK-7, are protein tyrosine phosphatases (PTPs) and are used to identify CC substances that modulate their activity (i.e. agonists and antagonists, CC including NBP) in vivo or in vitro. These substances are used to treat or prevent diseases associated with abnormal signal transduction pathways CC that involve the proteins, particularly cancer (e.g. leukaemia and CC lymphoma), while modulators of ALK-7 (which is a type I receptor CC serine/threonine kinase) are used to promote neuronal survival, CC diseases. Nucleic acid fragments of the polynucleotides encoding the proteins can be used as probes to identify and clone related sequences, to detect protein-encoded RNA; to generate transgenic animals and in gene therapy (optionally after mutation). Ab are used to determine the
